

HIKO™ trays are used in forest nurseries worldwide for the production of quality seedlings and cuttings. All HIKO trays are made of high quality, high density polyethylene for increased life expectancy. The plastic is durable, recyclable and easy to clean. Experience has shown that the trays will have a useful life of more than ten years. All tray cavities have vertical root training ribs and/or side slits. Side slits assure good aeration of the roots and create active root tips. The cell design of the HV90AB has side slits and active root guiding along the sides of the root ball.
