

Tray Covers

The **Tray Covers** fit over trays filled with cells prior to filling with soil. They prevent soil from working its way into the spaces between individual cells.

Stainless steel is very durable and rust resistant with the highest longevity. It functions the same as our plastic version but with much greater longevity.

The **Boltron** reusable plastic cover is an economical alternative to the stainless steel cover while providing the same great features.

Plastic is the most economical option for a tray cover.

Trays and cells are sold separately.
