

Tray Covers

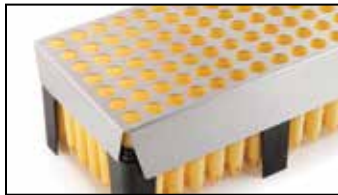

Tray Covers fit over trays filled with cells prior to filling with soil. They prevent soil from falling into the spaces between individual cells. The **stainless steel** is very durable and rust resistant. It functions like our plastic version but with much greater longevity. The **Boltron** reusable plastic cover is an economical alternative to the stainless steel cover while providing the same great features. **Plastic** is the most economical option for a tray cover.

Trays and cells are sold separately.
